How can this implemented database now be used?

My project is directed for indoor soccer even at Arcata, Blue Lake, McKinleyville. The location doesn't matter as a member of the club. You are allowed to also rent out these locations. The amount of fee highly depends on the length of time you will be renting it. Upon registering, user given member number. Their first name and last name are taken from them. They are free to give the club a email address and phone number but they don't have to do so. The club can hire staff. Staff are paid employees of the club. Coach and instructor of the club are also paid employee of the club by default. A coach or instructor can run a game and teach a course at the club. Player can enroll at the courses taught at the club. It doesn't matter how many players that wishes to enroll. The course can also teach as many players as possible. Each course has a room number and name of the course. There is no set fee yet implemented for the courses taught since not a lot of players are enrolling in it since the inception of the club. Injury that occurred during a game are logged by the players at the game. The injury can also be log separately for each game. A player can play for any team. They can play for as many team as they want to play for. A Team need a least more than player to start a team. A player can be a guess, family, or friend. They don't have to be either if they choose to. The same can occur for club member. A club member can be a player or a staff. They can choose to be none and still somehow be a member of the club.
